

System Information

What is it system information?

System Information is usually a list of specifics for your computer. The information here is for you to know what your computer specifications are.

Some of the system information found is:

-  Manufacturer
-  Model
-  Operating System
-  Processor
-  Memory
-  Product ID

When will I use it?

You may need that information when purchasing software, when you need to know how much memory you have and how much is left for use.

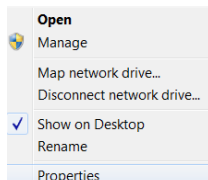

Where is the system information?

The easiest way to open system information in any Windows:

-  Right click the (My) Computer icon on the desktop

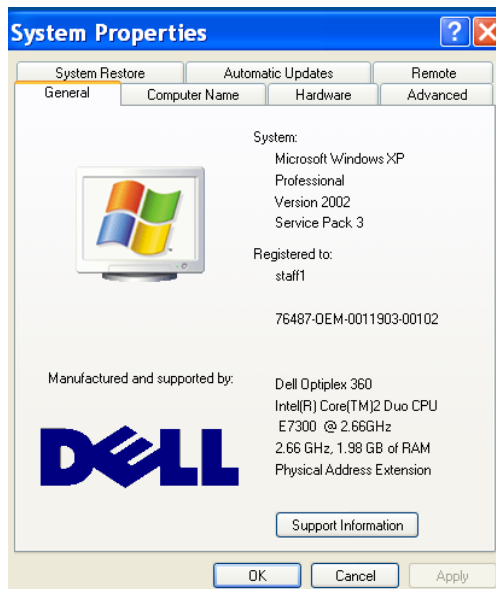

-  A small menu will open

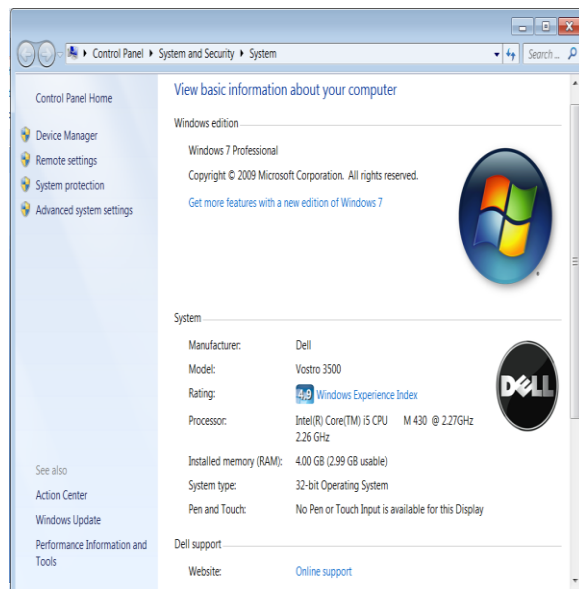

-  Click on Properties

Properties for system information will open for viewing. The window displayed is for Windows XP and Windows 7. Other versions of Windows will have similar looks, displaying the information in different ways. There may be tabs on a small window for the various specifications, or you just scroll down the page for more information.

Windows XP

Windows 7

Tip:

 You can also go through Help and Support or the Control Panel to find this information. You may get a little more information than is presented in these windows, especially in Windows 7.
